

## 13.React-HOL

### 1. Explain various ways of conditional rendering

React provides multiple ways to conditionally render elements:

- if / else statements inside a component function
- Ternary operator: condition ? trueComponent : falseComponent
- Logical AND (&&) operator: condition && component
- Element variables: assign different components to a variable and render it

### 2. Explain how to render multiple components

You can render multiple components using:

- Fragment `<>...</>` or `<React.Fragment>`
- Array of components
- Parent wrapping components

Example:

```
return (  
  <>  
    <Header />  
    <Content />  
    <Footer />  
  </>  
);
```

### 3. Define list component

A list component in React renders a list of items using `.map()`:

```
function BookList({ books }) {  
  return (  
    <ul>  
      {books.map(book => <li key={book.id}>{book.title}</li>)}  
    </ul>  
  );  
}
```

### 4. Explain about keys in React applications

- Keys help React identify which items changed, added, or removed in a list.
- Keys should be **unique and stable** (e.g., id of an item).
- Helps improve performance and maintain state consistency.

## 5. Explain how to extract components with keys

When rendering lists, extract child components and pass keys to the component itself:

```
function BookItem({ book }) {  
  return <li>{book.title}</li>;  
}  
  
function BookList({ books }) {  
  return (  
    <ul>  
      {books.map(book => <BookItem key={book.id} book={book} />)}  
    </ul>  
  );  
}
```

## 6. Explain React Map, map() function

- map() is used to iterate over arrays and return JSX for each element.
- It's a functional way to dynamically render lists.

Example:

```
const items = ['React', 'JS', 'HTML'];  
const list = items.map((item, index) => <li key={index}>{item}</li>);
```

## Hands-On

### Code: App.js

```
import React from 'react';  
import './App.css';  
import CourseDetails from './CourseDetails';  
import BookDetails from './BookDetails';  
import BlogDetails from './BlogDetails';
```

```
function App() {  
  return (  
    <div className="container">  
      <CourseDetails />  
      <BookDetails />  
      <BlogDetails />  
    </div>
```

```
);  
}
```

```
export default App;
```

### **BlogDetails.js**

```
import React from 'react';
```

```
function BlogDetails() {
```

```
  const blogs = [
```

```
    {
```

```
      title: 'React Learning',
```

```
      author: 'Stephen Biz',
```

```
      content: 'Welcome to learning React!',
```

```
    },
```

```
    {
```

```
      title: 'Installation',
```

```
      author: 'Schewzdenier',
```

```
      content: 'You can install React from npm.',
```

```
    },
```

```
  ];
```

```
  return (
```

```
    <div className="card blog-card">
```

```
      <h2>Blog Details</h2>
```

```
      {blogs.map((blog, index) => (
```

```
        <div key={index}>
```

```
          <h3>{blog.title}</h3>
```

```
          <p><strong>{blog.author}</strong></p>
```

```
          <p>{blog.content}</p>
```

```
        </div>
```

```
      )}}
```

```
    </div>
```

```
  );
```

```
}
```

```
export default BlogDetails;
```

### **BookDetails.js**

```
import React from 'react';

function BookDetails() {

  const books = [

    { title: 'Master React', price: 670 },

    { title: 'Deep Dive into Angular 11', price: 800 },

    { title: 'Mongo Essentials', price: 450 },

  ];

  return (

    <div className="card book-card">

      <h2>Book Details</h2>

      {books.map((book, index) => (

        <div key={index}>

          <h3>{book.title}</h3>

          <p>{book.price}</p>

        </div>

      ))}

    </div>

  );

}
```

```
export default BookDetails;
```

### **CourseDetails.js**

```
import React from 'react';

function CourseDetails() {

  const courses = [

    { name: 'Angular', date: '4/5/2021' },

    { name: 'React', date: '6/3/2020' },

  ];

  return (

    <div className="card course-card">
```

```

<h2>Course Details</h2>

{courses.map((course, index) => (

  <div key={index}>

    <h3>{course.name}</h3>

    <p>{course.date}</p>

  </div>

  )})

</div>

);

}

```

```
export default CourseDetails;
```

## OUTPUT
